

Customer Journey Map

Software Installation Request Automation in ServiceNow — Persona: Employee (Requester)

	ENTICE <i>How does the employee first become aware of the process?</i>	ENTER <i>What happens as they begin the request?</i>	ENGAGE <i>What happens in the core of the process?</i>	EXIT <i>What happens as the process finishes?</i>	EXTEND <i>What happens after the experience is over?</i>
Steps	Employee needs new software Hears about Service Catalog from IT/onboarding or colleague	Opens Service Portal Searches 'Software Installation Request' Fills form: Software Name, Version, Justification, Urgency	Clicks Order Now / Checkout Request routed to Manager Approval On approval, Fulfillment Task auto-created for IT Support	IT Support installs software Task marked Completed Requester notified of completion	Requester resumes work with software installed Can raise a follow-up or new request anytime via same catalog
Interactions / Touchpoints	Word of mouth, IT onboarding docs, intranet	Service Portal / Now Experience UI Catalog Item form & variables	Manager Approval (email/inbox) Workflow Editor (backend) sc_request / sc_req_item records	Email notification sc_task record updated by IT Support	Request history in portal ('My Requests') Email confirmation
Goals & Motivations	"Help me find an official way to request software instead of emailing IT."	"Help me submit my request quickly and correctly."	"Help me get approved and installed with minimal back-and-forth."	"Help me know my software is ready to use."	"Help me trust that future requests will be just as easy."
Pain Points (Before Automation)	No standard channel — relies on email/verbal requests	Unclear what info IT needs; inconsistent requests	No visibility into approval status; manual follow-ups	No confirmation when task is actually done	No record of past requests; repeats process from scratch
Opportunities (With Automation)	Promote the catalog item as the single intake channel	Guided form with mandatory fields ensures complete requests	Automated approval routing + task creation removes manual coordination	Auto-notification on completion builds trust and transparency	SLA tracking & request history support faster, self-service reordering
