

Project Design Phase

Proposed Solution Template

Date	01 September 2026
Project Type	Individual Project
Project Name	Software Installation Request Automation in ServiceNow Using Service Catalog and Workflows
Maximum Marks	2 Marks

Proposed Solution Template:

The following information describes the proposed solution for automating software installation requests in ServiceNow.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Employees manually request software installations via email or verbal communication. There is no structured process to submit, track, or fulfil these requests, leading to delays, inconsistent service, poor visibility, and increased IT workload.
2.	Idea / Solution description	Automate the entire software installation request lifecycle using ServiceNow's Service Catalog and Workflow capabilities: a dedicated catalog item captures the request, a workflow drives manager approval and auto-creates a fulfillment task for IT Support, a business rule raises an incident automatically on license shortage, and all configuration is packaged in an Update Set for clean migration across instances.
3.	Novelty / Uniqueness	Combines standard catalog intake with an automated exception-handling business rule (auto-incident creation on license shortage) — most basic catalog/workflow setups stop at approval + task creation and don't proactively surface fulfillment blockers as trackable incidents.
4.	Social Impact / Customer Satisfaction	Employees get a transparent, self-service channel with visible request status instead of chasing IT over email or in person. IT staff spend less time on manual coordination and more on resolving genuine issues, improving morale and turnaround time on both sides.
5.	Business Model (Revenue Model)	Internal IT Service Management (ITSM) solution — delivered as a configuration on the organization's existing ServiceNow license. Value is realized through reduced IT support overhead, faster request fulfillment, and SLA compliance rather than direct external revenue.
6.	Scalability of the Solution	Built using reusable ServiceNow constructs (catalog item, variables, workflow, business rule) captured in an Update Set, so the same pattern can be extended to additional catalog items (e.g., hardware requests, access requests) or rolled out to more departments and approval groups with minimal rework.
